

Stelmakh© Corp™ — Corporate Business Architecture for PostgreSQL

Product Description (Public Edition)

Perpetual License — 10,000 USD per installation

1. Executive Summary

Stelmakh© Corp™ provides a unified, enterprise-grade business architecture designed for companies, holdings, and multi-unit organizations.

The system delivers a consistent, normalized PostgreSQL data model covering legal entities, employees, assets, documents, finance, and operational units.

It is a ready-to-use foundation for ERP, CRM, DMS, HR, and financial systems — eliminating the need to design a corporate database from scratch.

The architecture is delivered under a perpetual license, allowing customers to deploy and modify the structure within their own infrastructure without recurring fees.

2. Business Architecture Overview

The Stelmakh© Corp™ architecture is built around a unit-based business model, enabling organizations to represent:

- Holding structures
- Subsidiaries
- Branches
- Departments
- Projects
- Operational units

This model ensures that all business data — documents, employees, assets, financial records — can be consistently linked to the correct unit, enabling clear reporting, accountability, and governance.

Core Principles

Unified data model — one consistent schema for all business domains.

Strict referential integrity — all relationships enforced via foreign keys.
Modular structure — each business domain is isolated but interconnected.
Scalable design — suitable for small companies and large holdings.
PostgreSQL-native — optimized for PostgreSQL 18+.

3. Architecture Modules

Legal Entities

Representation of companies, subsidiaries, and registered organizations.
Includes registration data, addresses, contact information, and lifecycle status.

Employees

Full employee registry: hiring, termination, contact details, and administrative assignments.

Assets

Tracking of physical and intangible assets, acquisition cost, ownership, and lifecycle.

Documents & Workflow

Document types, statuses, workflow stages, approvals, signatures, and links to units, employees, assets, and legal entities.

Finance & Capital

Charter capital, contributions, capital movements, reserves, bank accounts, expenses, and revenue.

Business Units

Hierarchical structure of the organization: holding → company → branch → department → project.

Administrative Roles

Internal administrative staff, permissions, and role-based access structure.

4. ERD Overview (High-Level)

The architecture includes a high-level Entity Relationship Diagram (ERD) showing:

- Legal entities
- Employees

- Assets
- Documents
- Finance modules
- Business units
- Administrative roles

The ERD is provided as a visual diagram only, without exposing SQL definitions or internal implementation details.

5. Key Benefits

Ready-to-use corporate foundation

Eliminates months of database design and architectural planning.

Consistent multi-unit structure

Ideal for holdings, multi-branch companies, and organizations with complex hierarchy.

Strict data integrity

All relationships enforced at the database level.

Vendor-independent

Runs on standard PostgreSQL — no proprietary extensions.

Perpetual license

One-time purchase, unlimited internal use.

Customizable

Customers may extend or adapt the schema to their internal needs.

6. Licensing Model

License Type

Perpetual, non-transferable, non-exclusive license for internal use.

Pricing

10,000 USD per installation

Price is calculated per physical or virtual server where the architecture is deployed.

Customer Rights

The customer may use, operate, and modify the architecture strictly within

their own company. The architecture may be integrated into internal systems (ERP, CRM, DMS, HR, Finance) and deployed on any infrastructure (on-premise, cloud, VM).

Installation Rights

The license grants the right to deploy the architecture on ONE physical or virtual server. Each additional server requires a separate license.

Usage Rights

The customer may modify the schema for internal purposes and integrate it into internal corporate systems. All usage is limited to internal, non-commercial operations within the customer's organization.

Prohibited Actions

- Redistribution of the architecture in any form.
- Resale, sublicensing, or transfer to third parties.
- Use of the architecture as part of a commercial product without a separate OEM agreement.
- Use of the architecture in SaaS, PaaS, or any multi-tenant service.
- Publishing, disclosing, or distributing SQL structure or internal implementation.
- Claiming authorship or removing Stelmakh© Corp™ branding.

Infrastructure Restrictions

The license does not permit deployment on:

- multiple servers under one license
- shared hosting environments
- multi-tenant cloud platforms (SaaS/PaaS)

7. Technical Requirements

PostgreSQL 18 or higher

Linux or Windows Server

8–16 GB RAM

4+ CPU cores

SSD storage (recommended 100 GB+)

Network access for internal systems (ERP/CRM/DMS/etc.)

8. Delivery Process

Customer purchases the license.
Customer receives the full SQL structure (Database Specification).
Customer deploys the architecture on their server.
Customer integrates the schema into their internal systems.
Customer maintains and operates the database independently.
No support or maintenance contract is required.
